Unless otherwise specified as detected (+) or non detected (-), the resistance gene is not expected to be found associated with this organism

+/- The resistance gene can be associated with the organism but it does not influence the common treatment options listed here

* When multiple organisms are present, interpret antibiotic resistant gene results in light of all identified organisms. Gene may also be found in organisms that aren't part of DxWound results.

§ Possible alternative if patient has a true penicillin allergy

† Consider consultation with ID specialist

‡ Consider checking sensitivity with beta-lactam antibiotics

** If susceptibility confirmed

†† Consider consultation with ID specialist if Extended-Spectrum b-lactamase (ESBL) or Carbapenem-Resistant Enterobacteriaceae (CRE) genes present

CRE Carbapenemase-Resistant Enterobacteriaceae

ESBL Extended-Spectrum beta-lactamase

MRCNS Methicillin-Resistant Coagulase Negative Staphylococcus

MRSA Methicillin-Resistant Staphylococcus aureus

MSSA Methicillin-Sensitive Staphylococcus aureus

VRE Vancomycin-Resistant Enterococcus

Disclaimer: This is not an all-inclusive antimicrobial treatment table and does not take into account local resistance patterns or all mechanisms of antimicrobial resistance. Uncommonly used antimicrobial coverage for specific organisms were omitted from this table, but may be appropriate in some patients. The DxWound Genetic Analysis Report does not make recommendations for treatment. All tests should be evaluated utilizing professional judgment in the clinical context of the patient. The test results should be used with other clinical and diagnostic findings for patient case management. Resistance genes may be associated with organisms detected by DxWound and listed here because extremely rare or not reported in the literature.
